

Oracle Cloud Infrastructure Bare Metal and KVM

Configure KVM and Oracle Linux 9 with Linux and Windows Guest VMs

August 14, 2025 | Version 1.1
Copyright © 2025, Oracle and/or its affiliates | [Public](#)

PURPOSE STATEMENT

This document will explain how to install and use Kernel-based Virtual Machine (KVM) on Bare Metal on OCI. The host operating system for KVM will be Oracle Linux 9. Once KVM is setup, we will create guest VMs. The main purpose of this document is to show how easy and quickly to provision a KVM Host.

WHY USE BARE METAL AND KVM?

Why use a Bare Metal? Bare metal compute instances are provisioned on an entire physical compute node, giving you direct access to the node's CPUs, memory, disks, network interface cards (NICs), and accelerators without any virtualization layer. Importantly, you do not share any hardware resources with other customers and have full control over the system once it has been provisioned to your tenancy. With the OCI console you can quickly deploy a single operating system such as Linux or Windows server on the Bare Metal compute instance. For a list of Bare Metal servers on OCI, refer to <https://docs.oracle.com/en-us/iaas/Content/Compute/References/computeshapes.htm#baremetalshapes>

Kernal-based Virtual Machine (KVM) is a virtualization solution integrated into the Linux kernel that turns a Linux system into a hypervisor, enabling it to run multiple isolated virtual machines (virtual computers) on the same physical hardware. These virtual machines can run Windows or Linux operating system, allowing for isolation of VMs on the same Bare Metal system.

Deploying KVM on Bare Metal has been made easy on Oracle OCI. The document will explain detailed steps to deploy KVM.

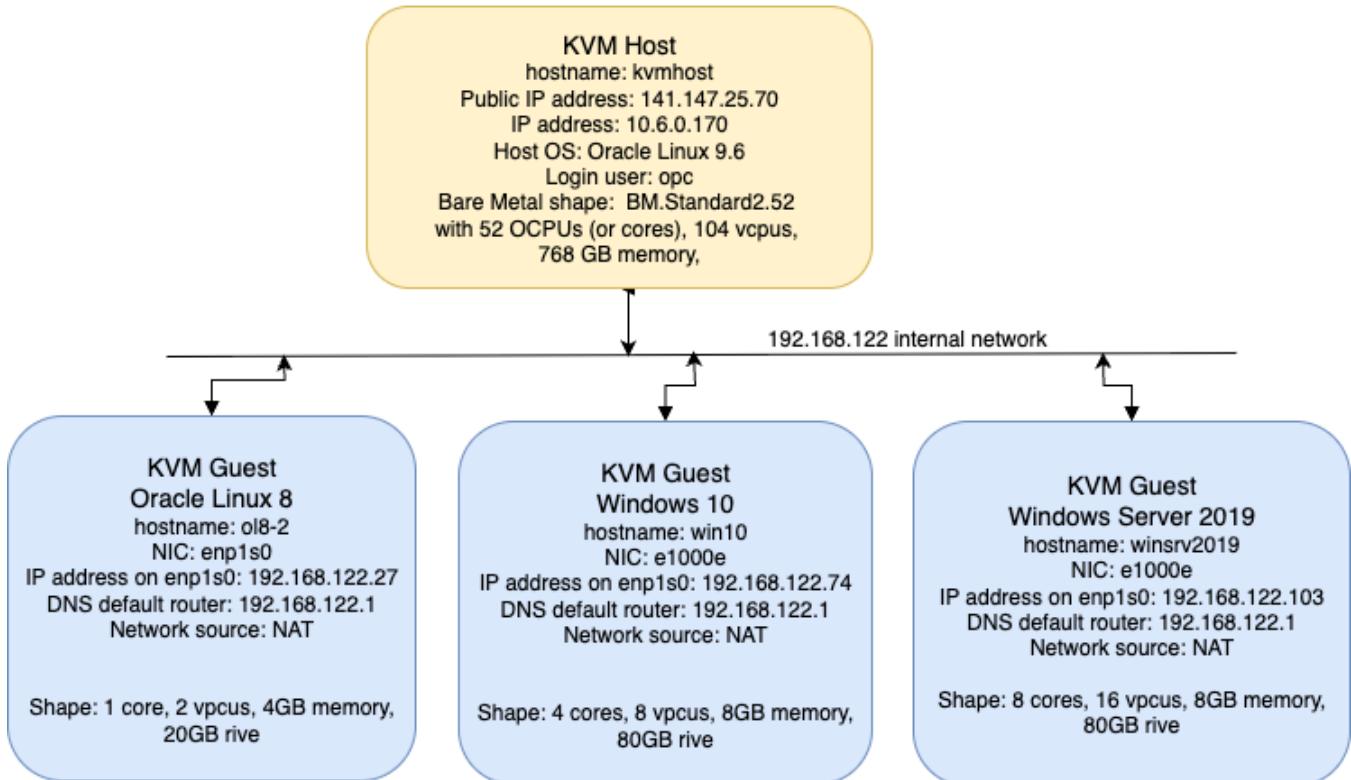

The next section will explain the architecture used for this lab.

ARCHITECTURE OVERVIEW

The KVM Host, which is named `kvmhost` and located in OCI Frankfurt region. The KVM Host will host several virtual machines such as Oracle Linux 8, Windows 10 desktop, and Windows Server 2019.

The Bare Metal server was created on a public subnet. The picture below shows the high-level architecture: Bare Metal on OCI with 3 Guest VMs.

Deploy KVM on Bare Metal hosted on Oracle Cloud Infrastructure

PROVISION BARE METAL IN ORACLE CLOUD INFRASTRUCTURE

Before installing and configuring the Bare metal (BM) compute instance in Oracle Cloud Infrastructure (OCI), check the prerequisites. Ensure there is enough storage space to store installation media (ISO images). We recommend 1TB for the boot volume and this will allow enough space to store ISO images.

This link shows KVM Host System requirements: <https://docs.oracle.com/en/operating-systems/oracle-linux/9/kvm-user/kvm-SystemRequirementsandRecommendations.html#support>

For this lab, we will deploy a bare metal server (BM.Standard2.52) on OCI in the Frankfurt region. This will be a standard installation of an OCI compute and Oracle Linux. The pictures below show the Bare Metal installation on BM.Standard2.52 using the full environment, all 52 cores. For more detail on how to deploy a compute instance on OCI, follow this link: <https://docs.oracle.com/en/learn/oci-basics-tutorial/index.html#introduction>

Here are the high level steps for KVM installation. Each step will be explained in more detail.

- Provision the Bare Metal BM.Standard2.52 with Oracle Linux 9 on OCI
- Connect to the KVM host using ssh
- Assign a password to the ‘opc’ user
- Access the OCI serial Console to monitor startup of the Bare Metal server
- Ensure Oracle Linux 9 is updated
- Install the KVM packages
- Validate the KVM installation
- Create Guest VMs
- Import KVM Guest VMs

Detailed steps to install and configure KVM are described in the next section.

PROVISION THE BARE METAL BM.STANDARD2.52 WITH ORACLE LINUX 9 ON OCI

In this lab, the Bare Metal BM.Standard2.52 is deployed in Frankfurt.

The pictures below show Bare Metal compute instance creation on OCI Console. Use 1 TB boot volume to host the Oracle Linux 9 operating system and ISO images.

The screenshot shows the OCI console interface for creating a Bare Metal instance. The top navigation bar includes 'Cloud', a search bar, and location 'Germany Central (Frankfurt)'. The main area is titled 'Basic information' (step 1). It asks to 'Create an instance to deploy and run applications, or save as a reusable Terraform stack for creating an instance with Resource Manager.' Fields for 'Name' (kvmhost) and 'Create in compartment' (MariusScholtz) are shown. The 'Placement' section follows, with a note about availability domains. Three options are listed: AD 1 (fyxu:EU-FRANKFURT-1-AD-1), AD 2 (fyxu:EU-FRANKFURT-1-AD-2), and AD 3 (fyxu:EU-FRANKFURT-1-AD-3). The 'Advanced options' section is collapsed. The 'Image and shape' section is expanded, showing progress 'Tasks Completed 0 of 4'. Navigation buttons at the bottom include 'Cancel', 'View estimated cost', 'Previous', and a large 'Next' button.

The picture below shows the shape and operating system selection.

CONNECT TO THE KVM HOST USING SSH

The default method for connecting to an Oracle Linux compute host on OCI is by using ssh. The IP Address of *kvmhost* is 141.147.25.70. To connect to this host, from your local system, use:

```
[myhost] $ ssh -i private-key opc@141.147.25.70
```

ASSIGN A PASSWORD TO THE ‘OPC’ USER

By default the opc password is not. Set the opc password to make it easy to log into the OCI serial console.

```
[opc@kvmhost ~]$ sudo passwd opc
```

ACCESS THE OCI SERIAL CONSOLE TO MONITOR STARTUP OF THE BARE METAL SERVER

From OCI console → click *kvmhost* → OS Management → Launch Cloud shell connection.

The picture below shows the Console output from *kvmhost* as it is booting up.

The screenshot shows a terminal window titled "Cloud Shell". The content of the terminal is the boot log of an Oracle Linux host named "kvmhost". The log starts with the kernel boot message and continues through various system initialization steps, including the start of network services, NFS peers, and the Open-iSCSI target. It also shows the configuration of the Cloud-init service, which handles network configuration, user session setup, and command schedulers. The log concludes with the finalization of the Cloud-init process and the startup of the OpenSSH server. There are several warning messages related to iSCSI session handling and broken pipes during recovery attempts.

```
Starting Update kernel loglevel for OCI instances...

Kernel 6.12.0-101.33.4.3.el9uek.x86_64 on an x86_64
Activate the web console with: systemctl enable --now cockpit.socket
kvmhost login: □
```

ENSURE ORACLE LINUX 9 IS UPDATED

Ensure the latest patches are applied to the KVM Host and then reboot the system.

```
[opc@kvmhost ~]$ sudo dnf update -y  
[opc@kvmhost ~]$ sudo init 6 (or use sudo shutdown -r now)
```

INSTALL THE KVM PACKAGES

Provision Install and configure KVM on OCI Bare Metal

To install Kernel-based Virtual Machine (KVM) on Bare Metal on OCI involves installing packages from Oracle Linux 9 repository. Two distinct stacks exist to install KVM packages. The table below list the difference between the two stacks. In our example we will deploy the “Default KVM Stack”.

Table 1: KVM Stack vs. Oracle KVM Stack.

CRITERIA	KVM STACK (DEFAULT)	ORACLE KVM STACK
Host running RHCK Red Hat Compatible Kernel	Yes	No, UEK kernel only
Host running with Unbreakable Enterprise Kernel	Yes	Yes
Provides newer functionality	Yes	Yes, even more than KVM Stack
Repository name: Different repositories are used	enabled by default: ol9_appstream sudo dnf reposlist	ol9_kvm_utils
Available from where?	Standard Oracle Linux package repositories or ULN channels. Disable the ol9_virt_utils yum repository or ol9_<arch>_virt_utils ULN channel.	Enable the ol9_kvm_utils yum repository or ol9_<arch>_kvm_utils ULN channel

You can easily change between the default KVM stack and Oracle Stack by using this guide:

https://docs.oracle.com/en/operating-systems/oracle-linux/9/kvm-user/kvm-OracleLinux9_SwitchKVMStacks.html#concept_gtw_lf5_lcc

Here are the different packages for each stack:

https://docs.oracle.com/en/operating-systems/oracle-linux/9/kvm-user/kvm-OracleLinux9_YumReposULNChannels.html

Install KVM packages on Bare Metal on OCI running Oracle Linux 9

In this lab we will deploy the default KVM Stack. Installation of KVM involved installing several rpm packaged from the ‘yum repository’.

```
[opc@kvmhost ~]$ sudo group install "Virtualization Host" "Virtualization Client"  
[opc@kvmhost ~]$ sudo init 6 (or use sudo shutdown -r now)
```

This link provides more detail on KVM package installation:

<https://docs.oracle.com/en/operating-systems/oracle-linux/9/kvm-user/kvm-InstallingKVMUserSpacePackages.html#kvm-linux-guest>

VALIDATE THE KVM INSTALLATION

After the packages have been installed, it is time to check if for a successful installation. If all checks return a PASS value, the system can host guest VMs. If any of the tests fail, a reason is provided and information is displayed on how to resolve the issue, if such an option is available.

This link provides more detail on KVM package validation:

<https://docs.oracle.com/en/operating-systems/oracle-linux/9/kvm-user/kvm-ValidatingtheHostSystem.html>

```
[opc@kvmhost ~]$ sudo virt-host-validate qemu
QEMU: Checking for hardware virtualization : PASS
QEMU: Checking if device '/dev/kvm' exists : PASS
QEMU: Checking if device '/dev/kvm' is accessible : PASS
QEMU: Checking if device '/dev/vhost-net' exists : PASS
QEMU: Checking if device '/dev/net/tun' exists : PASS
QEMU: Checking for cgroup 'cpu' controller support : PASS
QEMU: Checking for cgroup 'cpuacct' controller support : PASS
QEMU: Checking for cgroup 'cpuset' controller support : PASS
QEMU: Checking for cgroup 'memory' controller support : PASS
QEMU: Checking for cgroup 'devices' controller support : PASS
QEMU: Checking for cgroup 'blkio' controller support : PASS
QEMU: Checking for device assignment IOMMU support : PASS
QEMU: Checking if IOMMU is enabled by kernel : PASS
QEMU: Checking for secure guest support : WARN (Unknown if this platform has Secure Guest support)
[opc@kvmhost ~]$
```

WARN. This warning may be ignored. The secure guest support check is for AMD CPU, so when running on Intel it reports a warning. In this lab we are using Intel CPUs. For more detail, refer to <https://access.redhat.com/solutions/7060371>

This command shows the libvirt version:

```
[opc@kvmhost ~]$ rpm -q libvirt
libvirt-10.10.0-7.3.0.1.el9_6.x86_64
```

Manage and enable libvirt daemons:

https://docs.oracle.com/en/operating-systems/oracle-linux/9/kvm-user/kvm-OracleLinux9_ManageLibvrtdService.html

```
[opc@kvmhost ~]$ for drv in qemu network nodedev nwfilter secret storage interface;
do
    sudo systemctl enable virt${drv}.service;
    sudo systemctl enable virt${drv}d{-ro,-admin}.socket;
    sudo systemctl start virt${drv}d{-ro,-admin}.socket;
done
sudo systemctl enable virtproxyd.service
sudo systemctl enable virtproxyd-tls.socket
sudo systemctl start virtproxyd-tls.socket
```

CREATE KVM GUEST VMS USING COCKPIT

Create virtual machines using the Cockpit web console. The Cockpit web console is an Oracle Linux server administration tool designed for managing and monitoring Linux systems both locally and remotely. The graphical web console for management and administration is user-friendly and accessible to administrators at all levels of experience with Linux. The Cockpit installation package arrives out of the box and ready for use in most Oracle Linux distributions.

<https://docs.oracle.com/en/operating-systems/oracle-linux/cockpit/cockpit-install.html>

Cockpit videos and how to install:

<https://github.com/mariusscholtz/Oracle-Cloud-Infrastructure-resources/tree/main/cockpit>

<https://www.youtube.com/watch?v=L9fMWCRcqIE>

<https://cockpit-project.org/running.html>

To install Cockpit on the KVM Host, do the following:

```
[opc@kvmhost ~]$ sudo dnf install -y cockpit cockpit-machines  
[opc@kvmhost ~]$ sudo systemctl enable --now cockpit.socket  
[opc@kvmhost ~]$ sudo systemctl status cockpit.socket
```

OCI instances are configured by default to only allow inbound ssh traffic. To access the cockpit web console, which is served on port 9090, you can create an ssh local port-forwarding tunnel as follows. On your local machine, create an SSH tunnel that allows you to connect to the cockpit port on the KVM Host:

```
[myhost] $ ssh -i ~/keys/private-key -L 9090:localhost:9090 opc@141.147.25.70
```

After creating the tunnel on your local system, open a browser to <http://localhost:9090>

Login using opc credentials and tick “Reuse my password for privileged tasks”

This document provides more detail about Cockpit:

<https://github.com/mariusscholtz/Oracle-Cloud-Infrastructure-resources/tree/main/cockpit>

The pictures below show Cockpit web console. The KVM server is called *kvmhost*.

The screenshot shows the Cockpit web interface for the *kvmhost* server. The left sidebar has a dark theme with white text. The main area displays the following information:

- Health:** Shows 5 services have failed and the system is up to date. It also shows the last successful login was on Aug 06 at 12:16 PM.
- Usage:** Shows CPU usage at 0% of 104 CPUs and Memory usage at 6.4 / 750 GiB.
- System information:** Shows the model as Oracle Corporation ORACLE SERVER X7-2c, asset tag as 2124XC604G, machine ID as ff51f9cd112f4b62910f2c417f78f6ee, and it has been up for 3 minutes ago.
- Configuration:** Shows the hostname as *kvmhost*, system time as Aug 6, 2025, 10:17 AM, domain as Join domain, performance profile as balanced, cryptographic policy as Default, and secure shell keys as Show fingerprints.

The screenshot shows the Cockpit web interface for the *kvmhost* server. The left sidebar has a dark theme with white text. The main area displays the following information:

- Networking:** Shows two graphs for network traffic: Transmitting (Mbps) and Receiving (Mbps). Both graphs show activity between 11:56 and 12:00.
- Firewall:** Shows the firewall is Enabled with 2 active zones. There is a button to Edit rules and zones.
- Interfaces:** Shows a table of network interfaces with columns for Name, IP address, Sending, and Receiving. The interfaces listed are *eno2np0* (IP 10.6.0.170/24), *eno3np1* (IP 192.168.122.1/24), and *virbr0* (IP 192.168.122.1/24).

Creating a VM using Cockpit is easy. Click on Virtual machines → Create VM.
The picture below shows an example on creating an Oracle Linux 8 VM.

Create new virtual machine

The picture below shows the Cockpit functionality to list all virtual machines (VMs). The vm ol8-2 and windows 10 are running.

Name	Connection	State	Action Buttons
ol8-1	System	Shut off	<button>Run</button>
ol8-2	System	Running	<button>Shut down</button>
win11	System	Shut off	<button>Run</button>
windows10	System	Running	<button>Shut down</button>
winsrv2019-gui	System	Shut off	<button>Run</button>

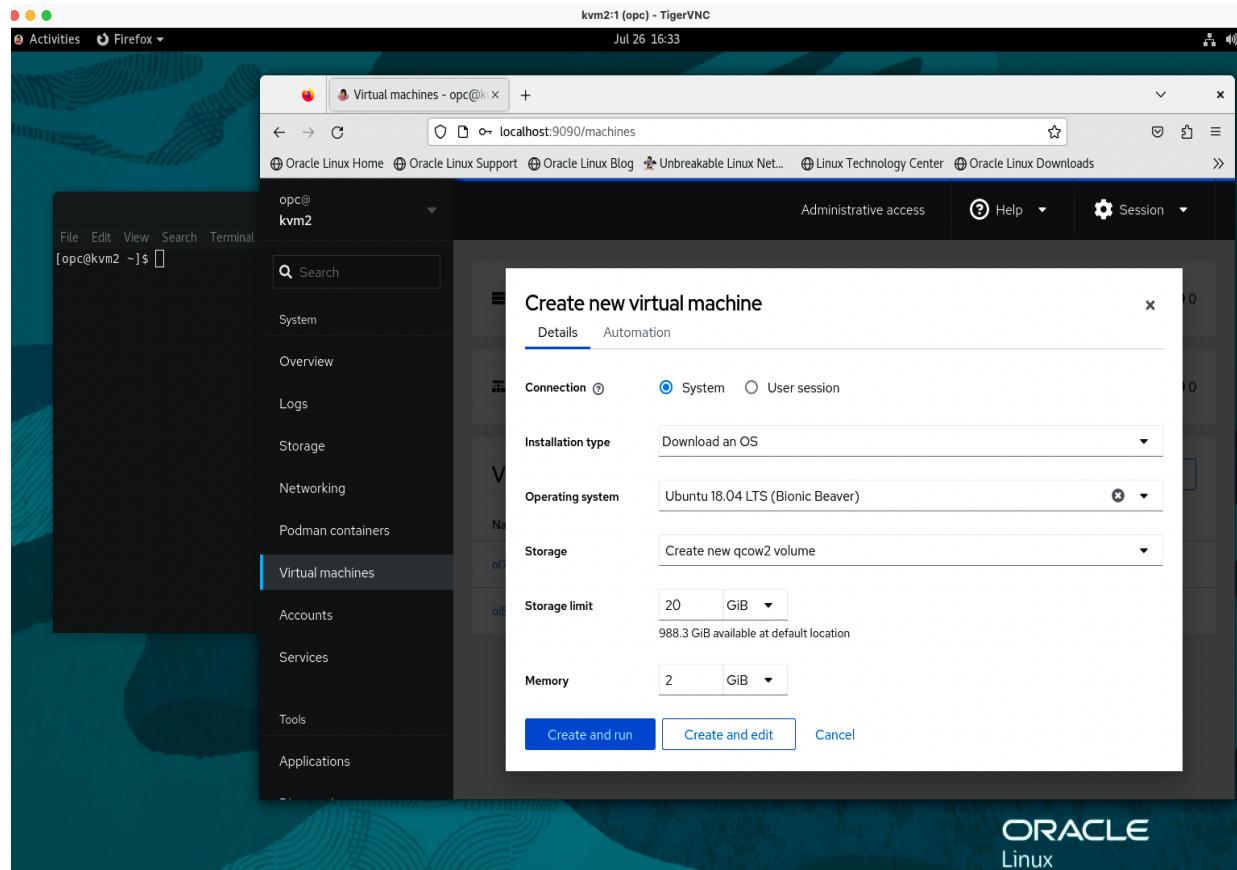

The picture below shows the Cockpit functionality to list the network. Click Virtual Machines → Click Network. NAT allows guest OS to connect to KVM host, and other guests on the network. Allow all guest VMs to connect to the Internet using the built-in virbr0 bridge.

Name	Device	Connection	Forwarding mode	State
default	virbr0	System	NAT	active

Configuration details for the default network:

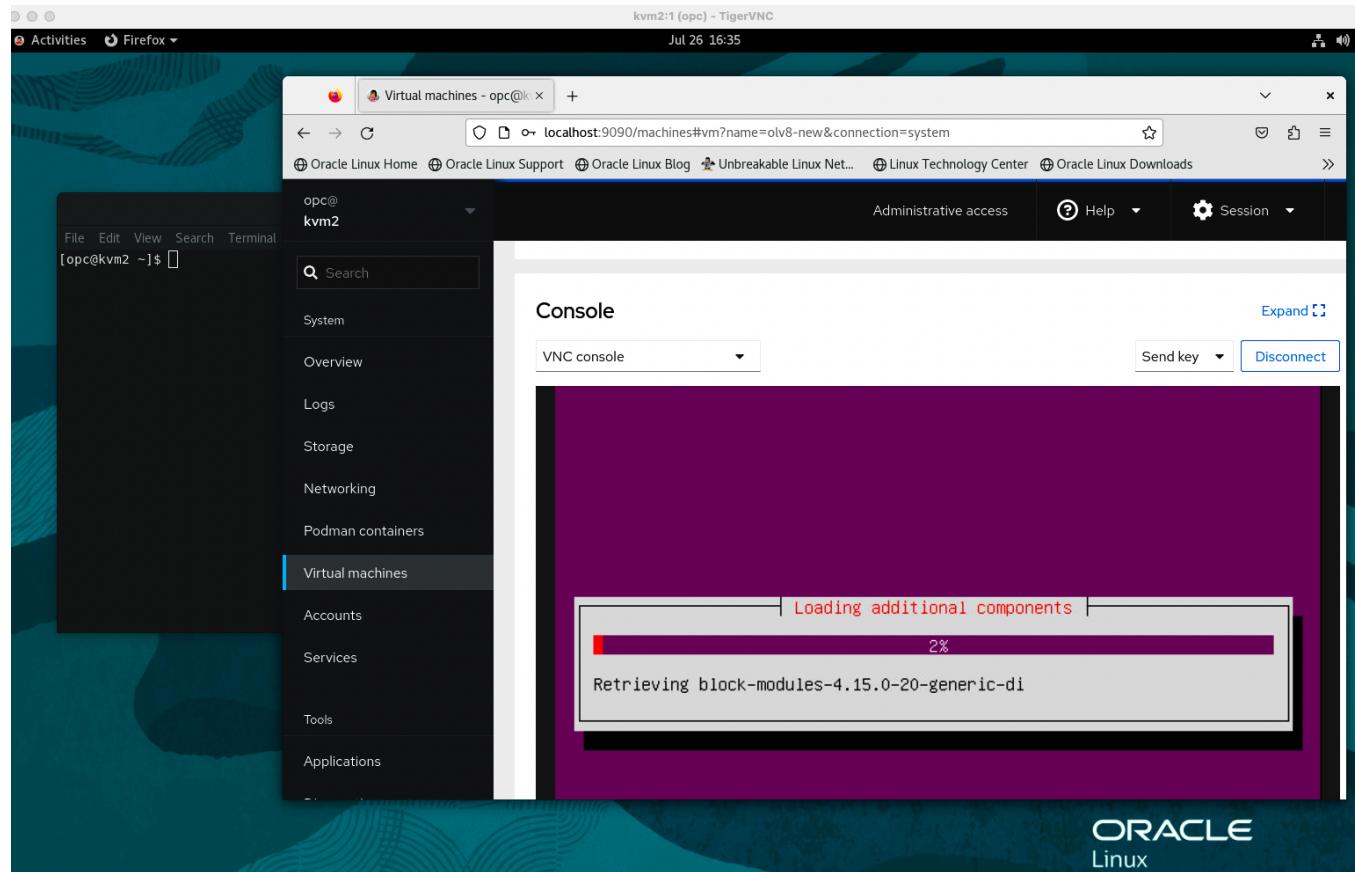

- General: IPv4 address
- Persistent: Address: 192.168.122.1
- Autostart: Run when host boots: 255.255.255.0
- DHCP Settings: Range: 192.168.122.2 - 192.168.122.254
- Static host entries: [add entry](#) none

Another example of how to Create a new VM using Cockpit:

Create a new VM ubuntu using cockpit:

In this example the boot file is located on /vm/ubuntu.qcow2.

CREATE KVM GUEST VMS USING VIRT-INSTALL

The command line tool virt-install is part of the KVM stack and allows for command line creation of virtual machines. For further reading, the virt-install documentation provides detail on KVM Guest creation:
<https://docs.oracle.com/en/operating-systems/oracle-linux/9/kvm-user/kvm-CreatingaNewVirtualMachine.html>

The example below shows the command virt-install for creating a KVM guest (VM) running Oracle Linux 8: The hostname is vmol3. Oracle Linux 8 requires at least 14 GB of disk space, 40 GB recommended. This will allow you to access the console and perform a text install of the OS. eno3 is an interface on the KVM server. Installation of VM takes about 15 min.

```
[opc@kvmhost ~]$ sudo virt-install --name=vmol3 --memory=2048 --vcpus=1 --location=/iso-images/OracleLinux-R8-U10-x86_64-dvd.iso --disk /vm/vmol2.qcow,size=14 --network type=direct,source=eno3 --os-variant=ol8.0 --nographics --console pty,target_type=serial --extra-args='console=tty0 console=ttyS0,115200n8 serial'
```

The picture below shows the console of the VM guest being installed.

```

Here is another example of creating Oracle Linux 8 guest VM using virt-install:

Create ol8-2 using command line

20 GB disk space, 4GB mem, 2 vcpu, networked

```
[opc@kvmhost ~]$ sudo virt-install --name=ol8-2 --memory=4096 --vcpus=2 --location=/iso-images/OracleLinux-R8-U10-x86_64-boot.iso --disk /var/lib/libvirt/images/ol8-2.qcow,size=20 --network default --os-variant=ol8.0 --nographics --console pty,target_type=serial --extra-args='console=tty0 console=ttyS0,115200n8 serial'
```

From kvmhost you can now ssh to the new ol8-2 host with IP address 192.168.122.27

More examples of virt-install:

https://docs.oracle.com/en/operating-systems/oracle-linux/9/kvm-user/kvm-CreatingaNewVirtualMachine.html#reference_gmx_mbt_ncc

CREATE KVM GUEST VMS USING VIRT-MANAGER AND TIGERVNC DISPLAY

The virt-manager application is a desktop user interface for managing virtual machines through libvirt. It primarily targets KVM VMs, but also manages Xen and LXC Linux containers. <https://virt-manager.org>

virt-manager is installed automatically as part of the KVM software suite:

```
[opc@kvmhost ~]$ sudo dnf group install "Virtualization Host" "Virtualization Client"
```

If virt-manager is not installed, you can manually install virt-manager using:

```
[opc@kvmhost ~]$ sudo dnf install -y virt-manager
```

Refer to <https://docs.oracle.com/en/virtualization/oracle-linux-virtualization-manager/>

To access virt-manager, install the desktop on the KVM host and access it using VNC Server:

Install virt-manager - KVM GUI. Create VNC session to kvmhost

The kvm host is running Oracle Linux 9.6

```
[opc@kvmhost ~]$ sudo dnf groupinstall "Server with GUI" - See Mos Doc 2153562.1
```

Start the local console and reboot the KVM host: sudo init 6: OCI Console → OS Management → Console Connection
→ Launch Cloud Shell Connection

Next create a console connection on the OCI compute instance or configure tigervnc to the VM:

```
[opc@kvmhost ~]$ sudo dnf install tigervnc-server -y
```

As opc user, configure vncpassword: \$ vncpasswd

Copy tigervnc libraries:

```
[opc@kvmhost ~]$ sudo cp /lib/systemd/system/vncserver@.service /etc/systemd/system/vncserver@\:1.service
```

```
[opc@kvmhost ~]$ sudo vi /etc/systemd/system/vncserver@\:1.service and replace USER with opc
```

Add a user mapping for opc user:

```
[opc@kvmhost ~]$ sudo vi /etc/tigervnc/vncserver.users
```

```
:1=opc
```

```
[opc@kvmhost ~]$ sudo systemctl daemon-reload
```

```
[opc@kvmhost ~]$ sudo systemctl enable vncserver@\:1.service
```

```
[opc@kvmhost ~]$ sudo systemctl start vncserver@\:1.service
```

```
[opc@kvmhost ~]$ sudo systemctl status vncserver@\:1.service
```

```
[opc@kvmhost ~]$ sudo firewall-cmd --list-all
```

```
[opc@kvmhost ~]$ sudo firewall-cmd --add-service=vnc-server --permanent
```

```
[opc@kvmhost ~]$ sudo firewall-cmd --reload
```

Open Tigervnc on your laptop to ip-address-of-kvmhost:5901, example:

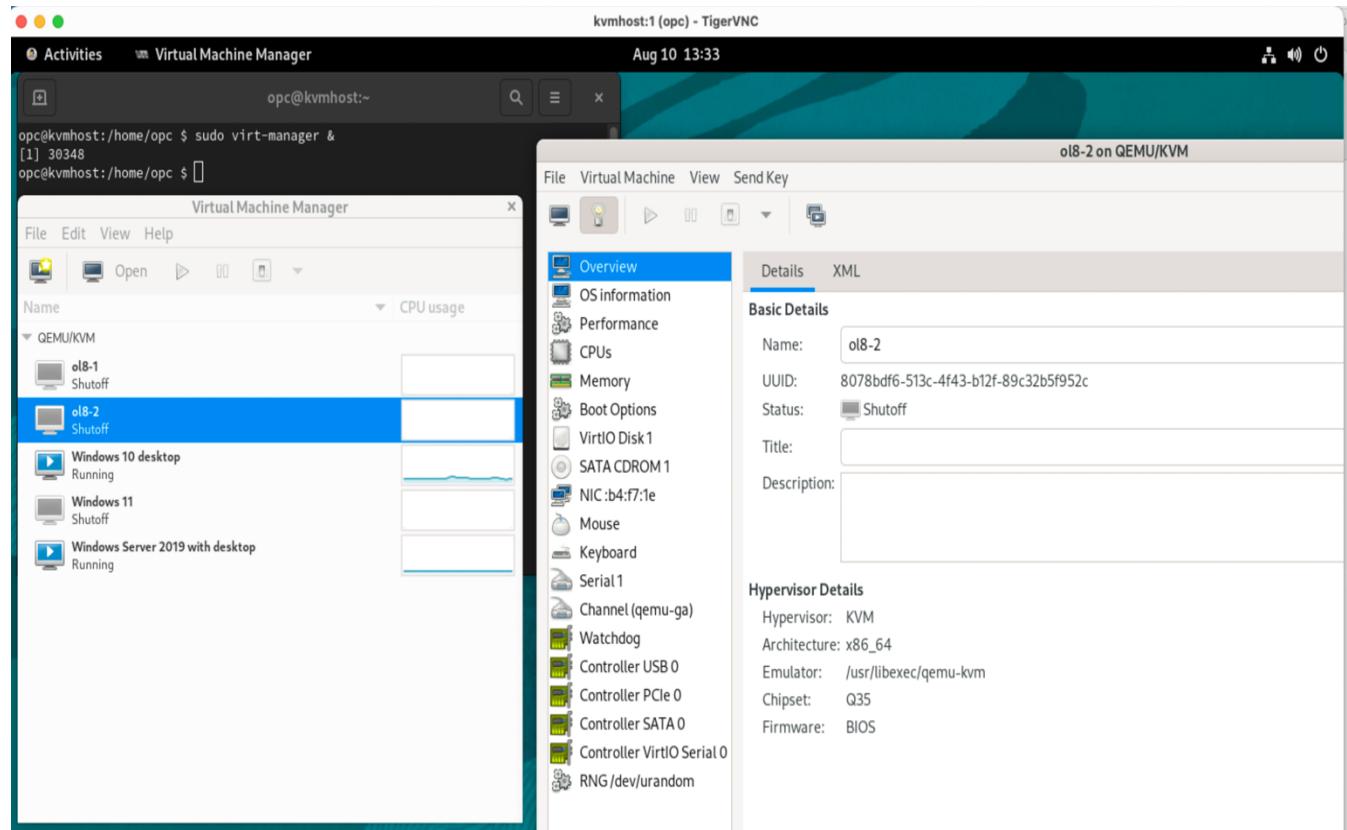

141.147.25.70:5901

Start virt-manager GUI:

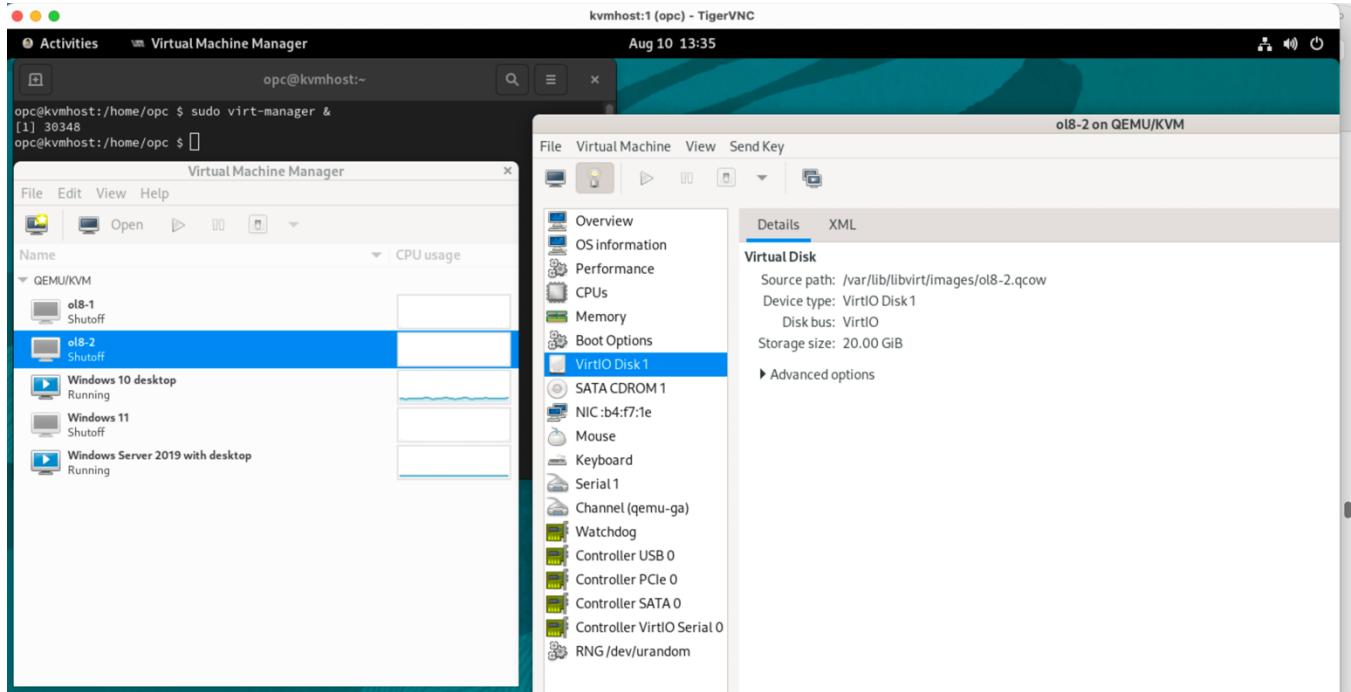

From a terminal on Oracle Linux KVM host, run:

```
[opc@kvmhost ~]$ sudo virt-manager
```

The pictures below show the virt-manager GUI.

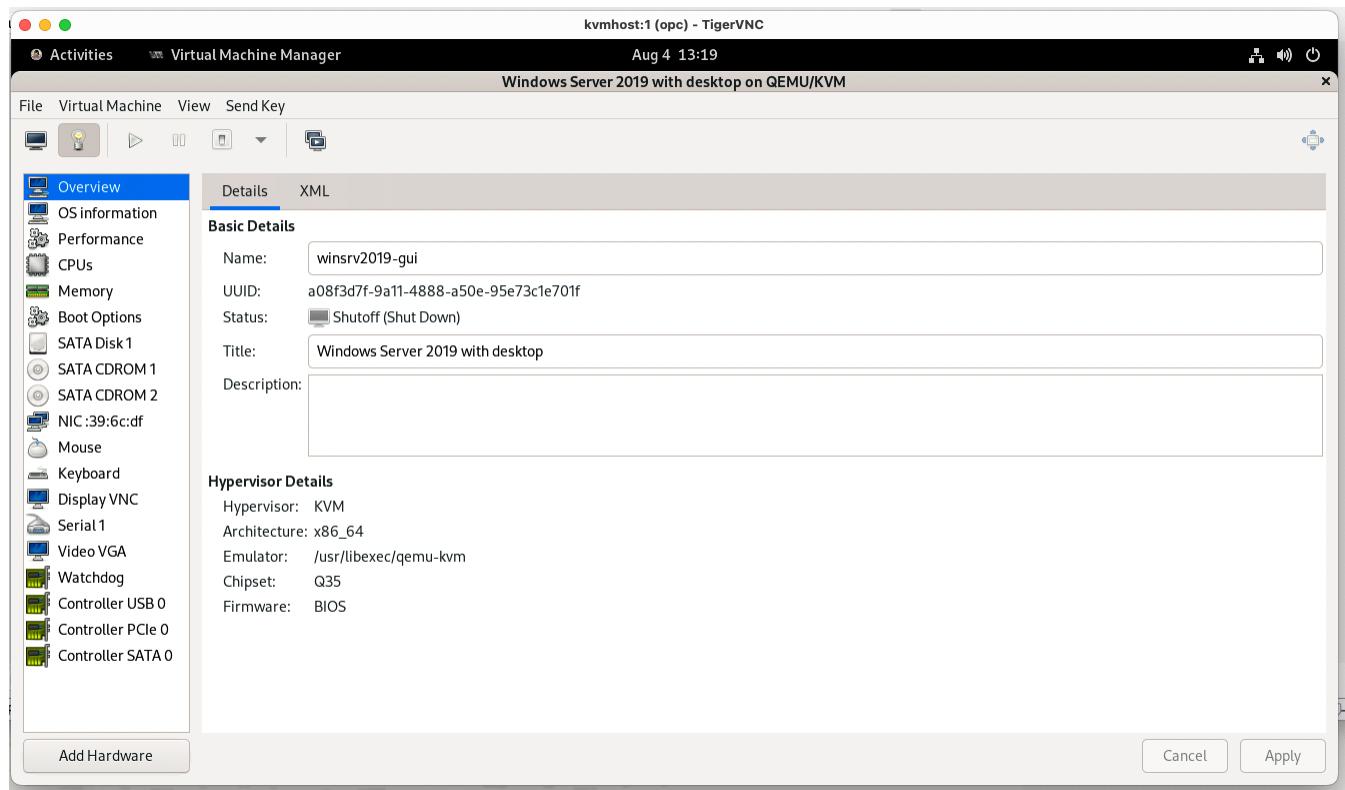

Use virt-manager to display detail of a guest VM (or guest OS):

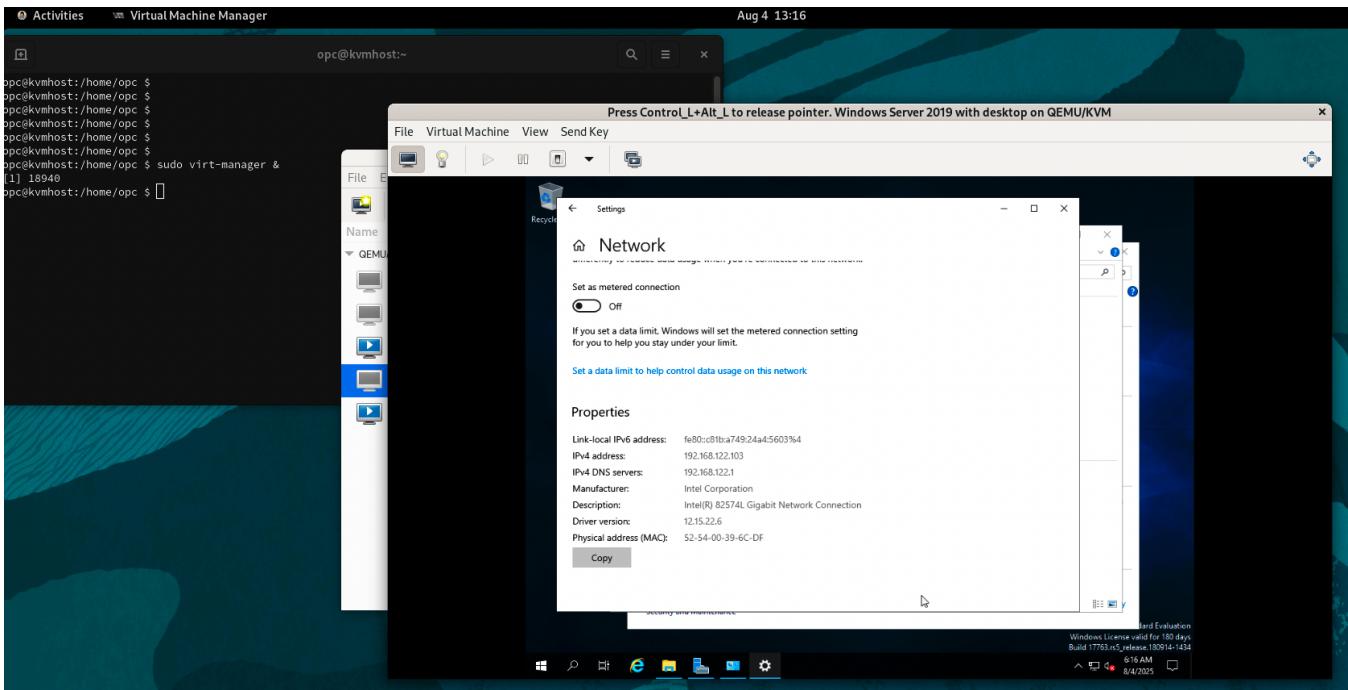

Install Windows Server 2019 guest OS on KVM using virt-manager

To install Windows Server 2019 on KVM host, ensure the following during configuration of the VM:

- Firmware is set to BIOS.
- Boot disk has 80GB or more.
- For GUI select Windows server 2019 Desktop Experience option during installation.
- Perform custom installation

Install Windows 11 guest OS on KVM using virt-manager

Most videos suggest using virt-manager instead of virt-install to install Windows guest on KVM.

To install Windows 11 guest OS on KVM see, <https://www.youtube.com/watch?v=7tqKBy9r9b4>

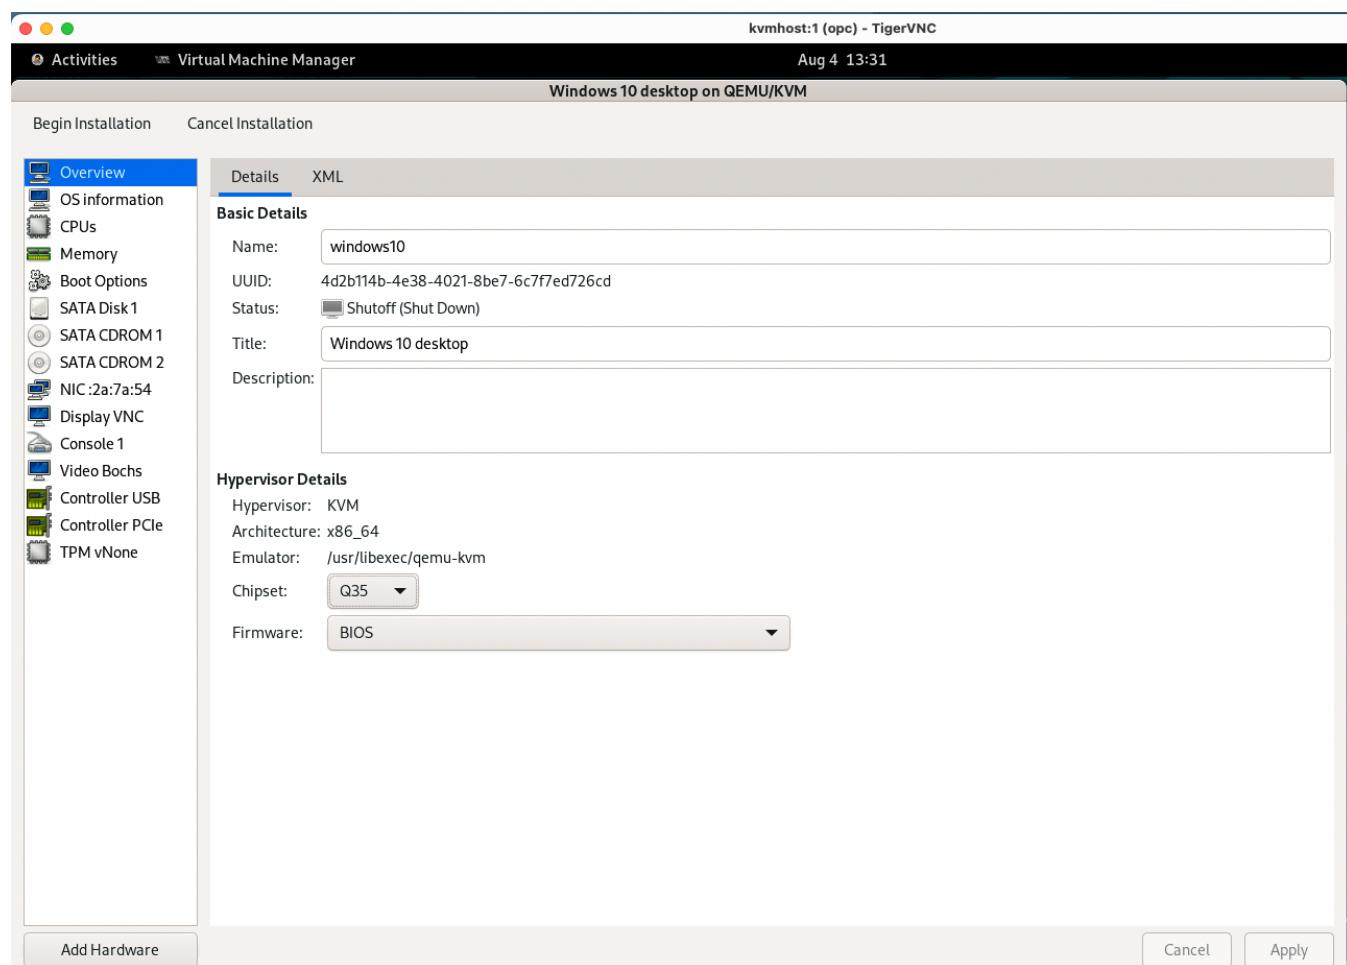

The installation of Windows 11 failed on this server because the CPU was too old. The Bare Metal server is BM.Standard2.52 with Intel Xeon Platinum 8167M, Base frequency 2.0 GHz, and does not meet the minimum requirements for Windows 11.

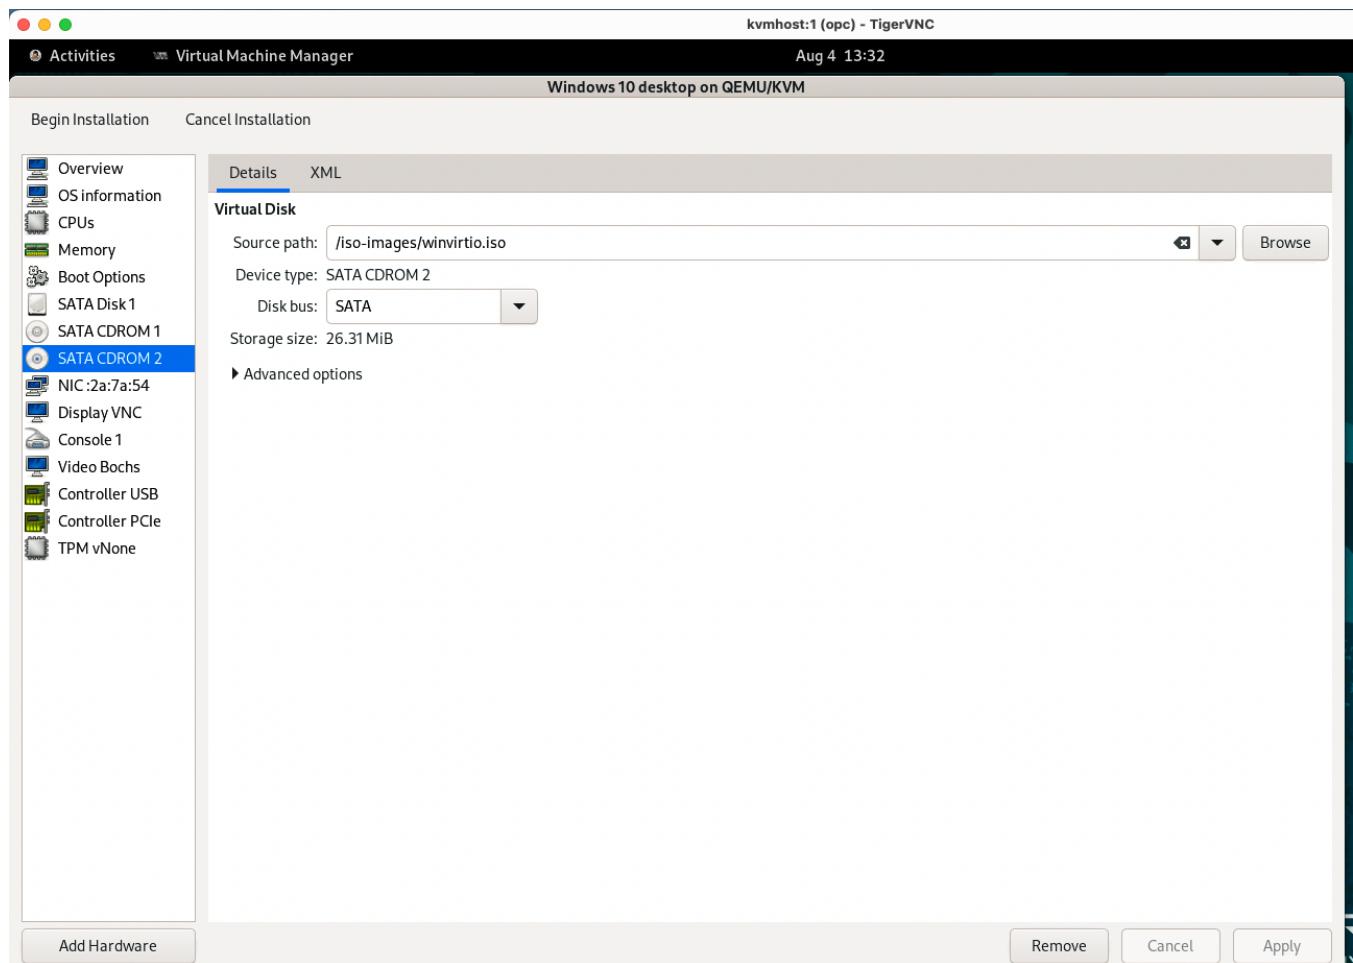

Install Windows 10 guest OS on KVM using virt-manager

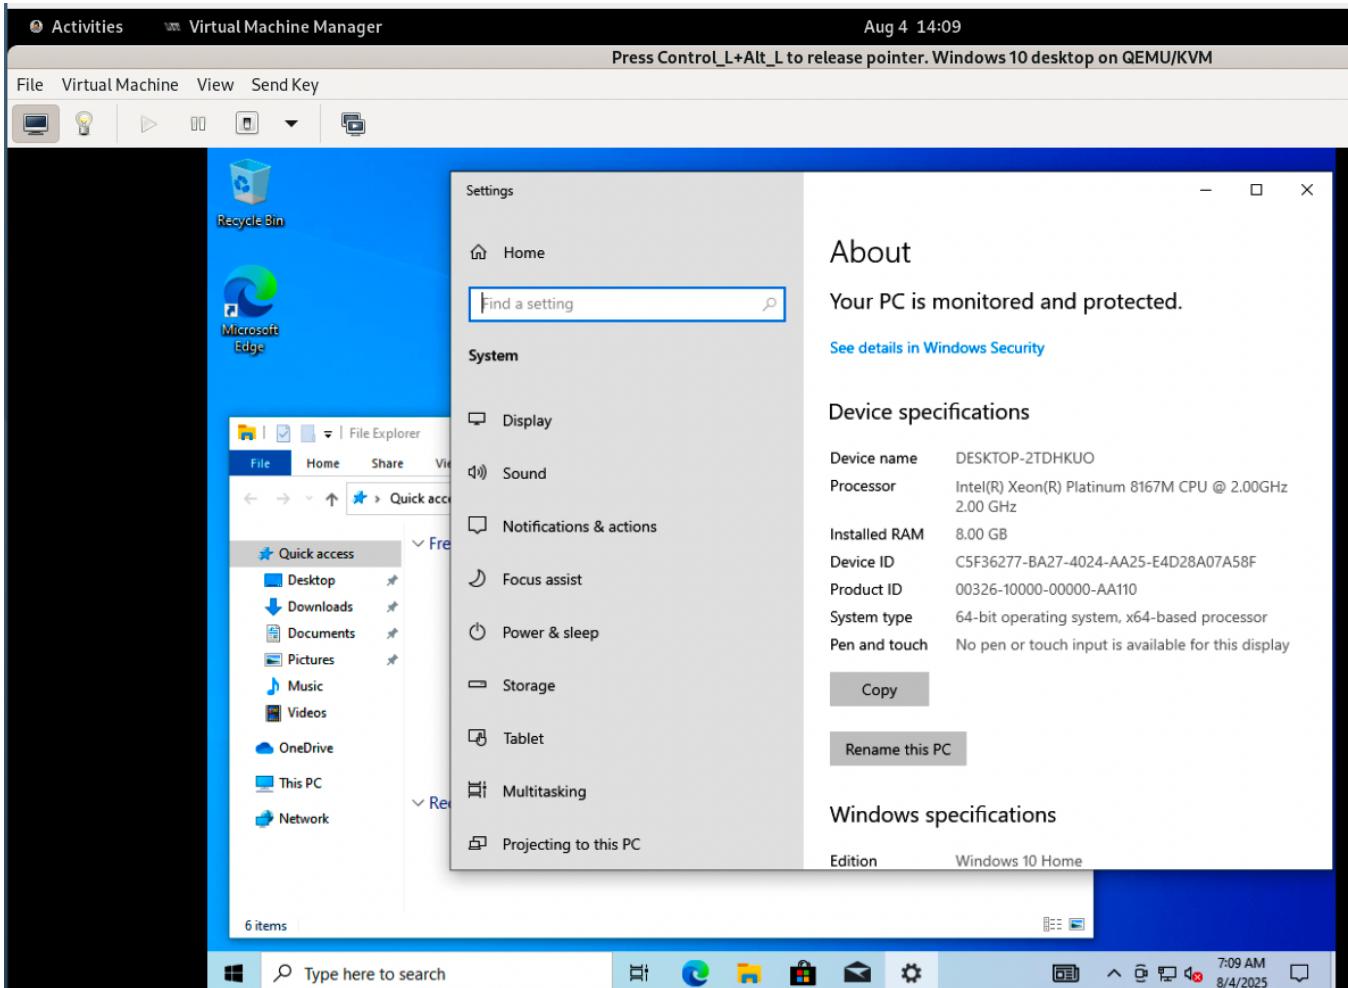

To install Windows 10 on KVM host, ensure the following:

- Firmware is set to BIOS.
- Boot disk has 80GB or more.
- Perform custom installation

The pictures below show Windows 10 creation detail using virt-manager.

IMPORT KVM GUEST VMS USING QEMU-IMG AND VIRT-MANAGER

QCOW2 is a storage format for virtual disks. QCOW stands for QEMU copy-on-write.

You can import an existing qcows2 disk into KVM and create a new Guest VM from this imported disk.

https://docs.google.com/document/d/1X8TaBP1v_rh8e2QXDGFmkmoPB13Pvp2V0FQ630VCsU/edit
and see <https://access.redhat.com/solutions/641193>

Migrate from VMWare to KVM by converting vmdk to qemu

Convert the disk image using this command: `sudo qemu-img convert -O qcows2 source.vmdk target.qcows2`

```
[opc@kvmhost ~]$ sudo qemu-img convert -O qcows2 CentOS_7.9.vmdk Centos79-new.qcows2  
https://foswiki.org/Support/HowToRunVirtualMachineImageOnKvmQemu
```

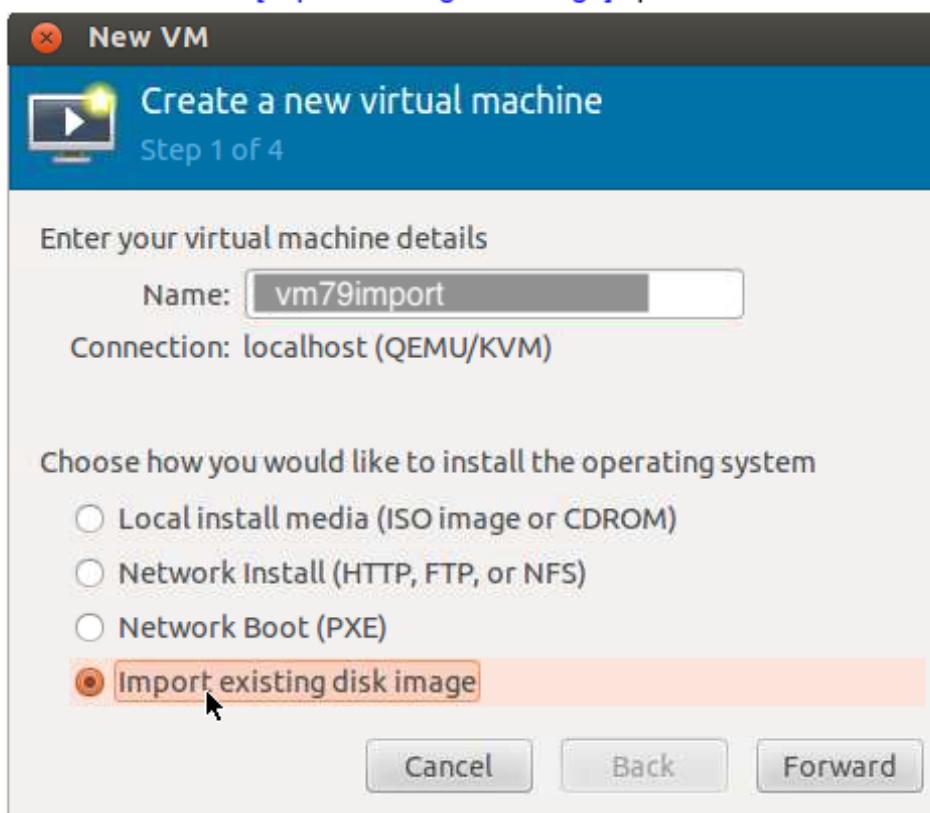

In this example I have used an existing qcows2 disk images from an older Oracle Linux 7.9 VM. This image is called `/vm/vm0179`.

```
[opc@kvmhost ~]$ ls -lh vm0179  
-rw----- 1 qemu qemu 21G Jul 30 11:27 vm0179
```

To import the vm, start virt-manager and create new VM from existing disk. See virt-manager section in this document.

Provision a VM from virt-manager GUI interface

Step 1: Create a new VM from [Import existing disk image] option

Step 2: Choose your qcows2 image

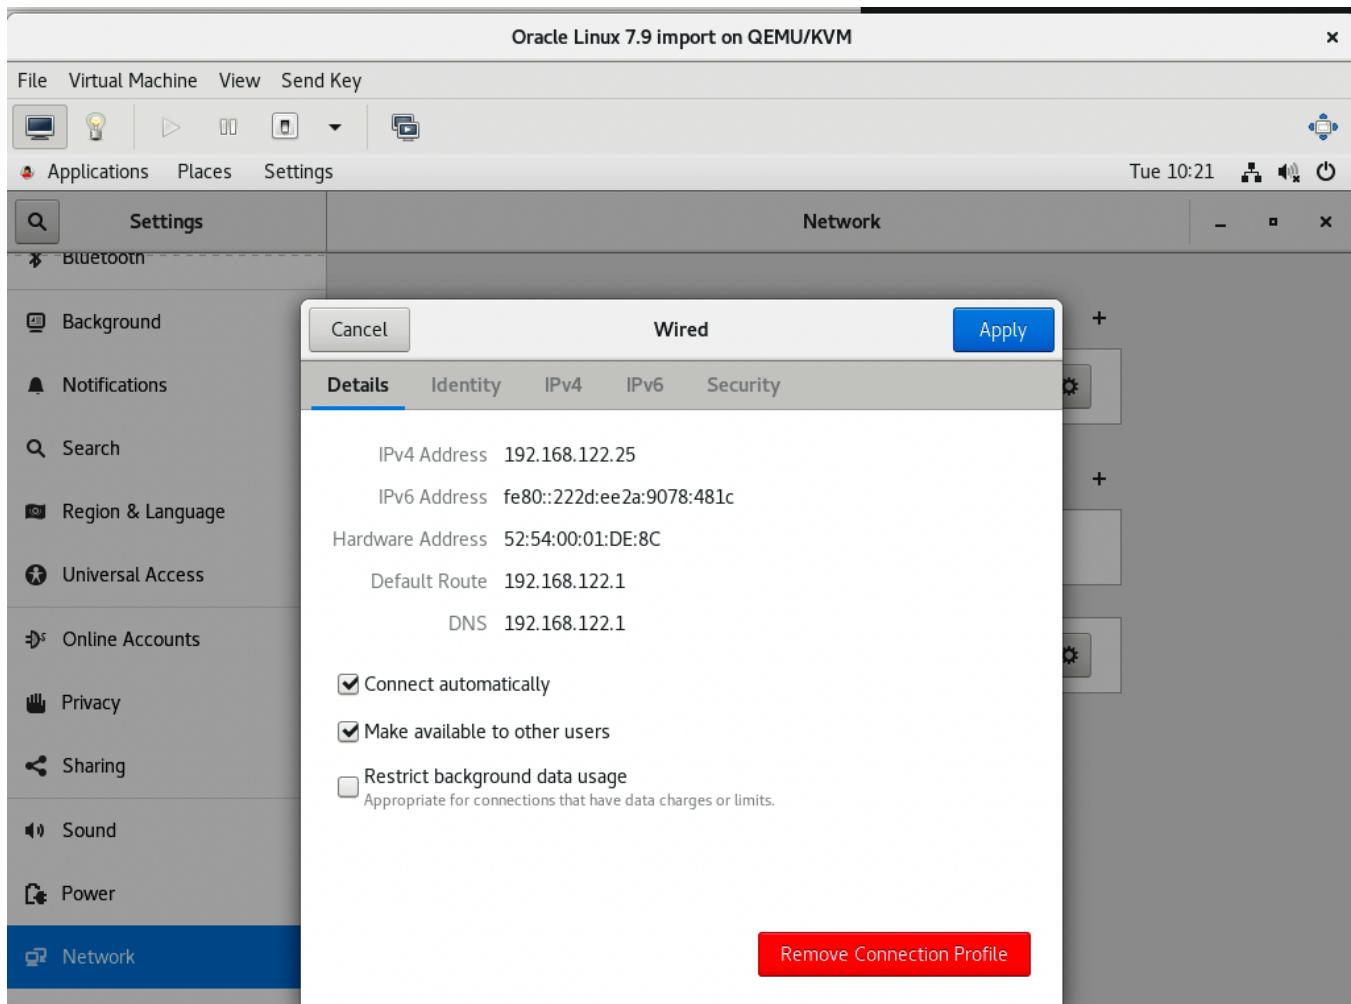

This picture shows detail about the VM boot disk:

The screenshot shows the Oracle VM Manager interface with the title "Oracle Linux 7.9 import on QEMU/KVM". The left sidebar lists various configuration options: Overview, OS information, Performance, CPUs, Memory, Boot Options, **VirtIO Disk 1**, NIC :01:de:8c, and Tablet. The "Details" tab is selected in the top right. The main pane displays the following details for "Virtual Disk":
Source path: /vm/vm0179
Device type: VirtIO Disk 1
Disk bus: VirtIO
Storage size: 20.00 GiB
A "► Advanced options" link is also present.

This picture shows detail about the VM:

The screenshot shows the Oracle VM Manager interface with the title "Oracle Linux 7.9 import on QEMU/KVM". The left sidebar lists various configuration options, with "Overview" selected. The "Details" tab is selected in the top right. The main pane displays the following basic details for the VM:
Name: ol79import
UUID: d3f003d3-84cb-4d10-a804-d8f1bcb31e49
Status: Running (Booted)
Title: Oracle Linux 7.9 import
Description: Oracle Linux 7.9 import using existing qcow2 disk image
Below this, the "Hypervisor Details" section shows:
Hypervisor: KVM
Architecture: x86_64
Emulator: /usr/libexec/qemu-kvm
Chipset: Q35
Firmware: BIOS

This picture shows detail about the VM networking:

LICENSING

Running Windows Server as KVM Guest OS requires a license. Customers are to ensure they have proper licensing. See <https://docs.oracle.com/en-us/iaas/Content/Compute/References/licensing-options-microsoft.htm>

Oracle Linux KVM or Oracle VM Server may be used as hard partitioning technology only as described in the following documents: Oracle Linux KVM, only if specific cores are allocated per the following document: <https://www.oracle.com/a/ocom/docs/linux/ol-kvm-hard-partitioning.pdf>

Bring Your Own License (BYOL): You can use your existing Microsoft licenses (e.g., Windows Server, SQL Server) on OCI KVM Bare Metal if your licenses have applicable Software Assurance and License Mobility rights.

License Included (LI): OCI typically provides "license included" options for its Compute virtual machines, **not** for Bare Metal or custom KVM deployments. For KVM Bare Metal, you usually need to bring your own licenses.

KVM ADMINISTRATION

See Oracle Linux KVM User's Guide: <https://docs.oracle.com/en/operating-systems/oracle-linux/kvm-user/kvm>AboutOracleLinuxKVM.html>

virsh commands: <https://www.redhat.com/sysadmin/virsh-subcommands>

For admin tasks, use virt-manager or cockpit.

CLI virsh can also be used: List of virsh commands: <https://www.redhat.com/sysadmin/virsh-subcommands>

To start a VM, run the following command:

```
[opc@kvmhost ~]$ sudo virsh start ol8-2
```

Access the vm console from the kvm server:

```
[opc@kvmhost ~]$ virsh console ol8-2  
Escape character is ^] (Ctrl + J)
```

To reboot a VM, run the following command:

```
[opc@kvmhost ~]$ sudo virsh reboot ol8-2
```

Lists all running domains (VMs):

```
[opc@kvmhost ~]$ sudo virsh list --all  
Id Name State  
-----  
- ol8-1 shut off  
- ol8-2 shut off  
- win11 shut off  
- windows10 shut off  
- winsrv2019-gui shut off
```

Show VM information:

```
[opc@kvmhost ~]$ sudo virsh dominfo ol8-2  
Id: 1  
Name: ol8-2  
UUID: 8078bdf6-513c-4f43-b12f-89c32b5f952c  
OS Type: hvm  
State: running  
CPU(s): 2  
CPU time: 47.6s  
Max memory: 4194304 KiB  
Used memory: 4194304 KiB  
Persistent: yes  
Autostart: disable  
Managed save: no  
Security model: selinux  
Security DOI: 0  
Security label: system_u:system_r:svirt_t:s0:c341,c875 (enforcing)
```

CPU en mem info of VM Guest:

```
[opc@kvmhost ~]$ sudo virsh vcpuinfo ol8-2  
VCPU: 0  
CPU: N/A
```

*State: N/A
CPU time N/A
CPU Affinity: yyyy...yyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyy...*

*VCPUs: 1
CPU: N/A
State: N/A
CPU time N/A
CPU Affinity: yyyy...yyyyyyyyyyyyyyyyyyyyyyyyyyyy...*

IP Address info of VM Guest:

```
[opc@kvmhost ~]$ sudo virsh domifaddr ol8-2
Name MAC address Protocol Address
```

```
vnet0 52:54:00:b4:f7:1e ipv4 192.168.122.27/24
```

```
[opc@kvmhost ~]$ sudo ip -d link show
```

modify prompt for KVM host or guest VM Oracle Linux: Add to ~/.bashrc

```
PS1=$LOGNAME@`uname -n`:$PWD $';export PS1
```

Delete a guest VM:

```
[opc@kvmhost ~]$ sudo virsh destroy ol8-2
```

The dumpxml subcommand dumps the XML configuration for a given domain.

```
[opc@kvmhost ~]$ sudo virsh dumpxml ol8-2
```

Hypervisor information:

```
[opc@kvmhost ~]$ sudo virsh sysinfo
[opc@kvmhost ~]$ sudo virsh version
```

Ensure KVM modules are loaded:

```
[opc@kvmhost ~]$ sudo modinfo kvm |grep modules
filename: /lib/modules/6.12.0-101.33.4.3.el9uek.x86_64/kernel/arch/x86/kvm/kvm.ko.xz
```

```
[opc@kvmhost ~]$ rpm -q libvirt
libvirt-8.0.0-23.2.0.1.module+el8.10.0+90363+955e9a81.x86_64
```

```
[opc@kvmhost ~]$ sudo systemctl status libvirdt
```

```
[opc@kvmhost ~]$ cat /etc/resolv.conf
nameserver 169.254.169.254
```

Restart KVM guest network service:

```
[opc@kvmhost ~]$ sudo service network restart
```

Reboot KVM Host

if you reboot kvm host, does the vm also reboot gracefully? No, No, KVM does not automatically shut down guests gracefully when the host reboots; the guest VMs are instead abruptly terminated, which is similar to pulling the power plug and risks data corruption. To achieve a graceful shutdown, you must manually shut down each virtual machine before rebooting the host or implement a custom script to send shutdown signals to the guest VMs and wait for them to complete before proceeding with the host shutdown.

From the login prompt of the KVM host, stop the VMs first:

```
[opc@kvmhost ~]$ sudo virsh shutdown <VM_Name>
```

```
[opc@kvmhost ~]$ sudo vistsh list -all
```

Once all VMs are stopped, then reboot the KVM host:

```
[opc@kvmhost ~]$ sudo init 6 or do sudo shutdown -r now
```

You can write a script that runs before the host's shutdown process begins.
